

Guidance on the partners integration process to the Elementpay payment system

Purpose of the document:

This guidance is intended for partners and serves to complete the integration process between a partner (hereinafter "Merchant") and the Elementpay payment system.

Key points of the integration process:

1. Merchant: Creation an integration team on the merchant side
2. Elementpay: Creation of an integration chat between the integration team of the Elementpay payment system and the merchant (see "Regulations of the integration chat" below).
3. Elementpay: Providing the merchant with the access to the personal cabinet.
4. Merchant: Payin integration. Integration of [Merchant API](#) and [Callback API](#) to implement the functionality of creating and processing payments.
5. Merchant: Successful completion of the Gateway test in Tidem. **The Tidem test is only required for the following integration types: Light API/Full Integration and is not required for integration via CMS plugins.** This test checks that the merchant's endpoint responses to system callbacks are correct and conform to the contract.
 - a. The completed test confirms the successful finishing of the Payin integration and is the basis for creating personal cabinet in the production environment. After successfully completion of the test in Tidem, the merchant needs to notify the payment system integration team about this in the integration chat.
6. Elementpay: Enabling personal cabinet in the Production environment. After successfully passing the test in Tidem, as well as after passing the KYC procedure and signing the Agency Agreement, the merchant gets access to an account in the production environment, which will allow the merchant to start accepting real payments from the customers.
7. Merchant: Payout integration. Implementation of work with [Clients API](#), [Transfer API](#) and [Authorizer API](#) for withdrawals from the system through the transfer service (transfers from the system from the merchant's balance to the individuals bank accounts) in the sandbox environment.
 - a. ⚠️ N.B. Withdrawing funds from the system by the Authorizer service (service for automatic transfers authorization) is convenient and significantly saves the merchant's time.
8. Merchant: Successful transfer authorization through the Authorizer service in a sandbox environment. After successful authorization of the transfer through the Authorizer service, the merchant needs to notify the payment system integration team about this in the integration chat.
9. Merchant and Elementpay: Signing an additional agreement (Addendum to the Agency Agreement) on the acceptance of risks by the merchant when enabling the Authorizer service.
10. Merchant: Sends a request to email support@elementpay.io to connect the Authorizer service in the production environment.
11. Elementpay: Enable the Authorizer service for the merchant personal cabinet in the production environment.

⚠ ATTENTION!

The Authorizer becomes available to the merchant in the production environment (Live mode) only after:

- signing of [Addendum to the Agency Agreement about risks of using the Authorizer Service](#)
- successful authorization of the transfer using the Authorizer service in personal cabinet in the sandbox environment (see clause 8)

After completing all the points, the integration of the merchant is considered to be fully completed.

Regulations of the integration chat

Working hours: the integration team will be happy to help and answer questions on business days from 10:00 to 18:00 (GMT+7, io/Bangkok).

Integration chat is intended to:

- discussing technical issues regarding the integration process;
- operational communication on urgent issues (for example, in case of problems in the operation of services in the production environment).

For other questions, please send a request to the support team by email: support@elementpay.io

Integration types

Depending on the needs and preferences of the merchant, we offer a choice of several options for connecting the merchant's system to our payment system:

- **CMS plugin**

CMS plugin is the easiest way, which already contains the [Callback API](#) and does not require independent implementation on the merchant side.

The merchant needs to select the appropriate plugin, depending on the CMS used, and, following the instructions inside, download and install it on the online resource.

CMS	Software Versions	Downloads
Wordpress v4.3 - 5.x (PHP 7.x)	PHP v7.2 or later	Download
	WooCommerce v3.3.4 or later	
PrestaShop v1.7	PHP v5.6.x — 7.x	Download
Drupal v7.67 or later	Drupal commerce v1.15 or later	Download
	PHP v5.6 or later	
Drupal v8.7.10 or later	Drupal commerce v2.15 or later	Download
	PHP v7.1 or later	

Please note: **Tidem test is not required** for this type of integration

- **Light API**

Light API is the second in terms of ease of connection and the general method that allows merchant to quickly integrate on almost any online resource.

[LightApi](#) can be integrated in two ways:

1. Through jQuery Plugin (JavaScript)
2. Through a link opened in an iframe

Also the merchant will need to write an implementation of working with the [Callback API](#)

Please note: **Tidem test is required** for this type of integration

- **Full integration**

The merchant needs to write an implementation on his side to interact with:

- [Merchant API](#)

- [Clients API](#)

- [Callback API](#)

- [Transfer API](#)

- [Authorizer API](#)

Please note: **Tidem test is required** for this type of integration

Information for testing:

Test cards (sandbox environment)

BRAND	NUMBER	CVC	DATE	NAME
Visa	4242424242424242	Any 3 digits	Any future date	Any Name
MasterCard	5555555555554444	Any 3 digits	Any future date	Any Name
JCB	3566002020360505	Any 3 digits	Any future date	Any Name
UnionPay	6200000000000005	Any 3 digits	Any future date	Any Name

Help with testing in the production environment:

At the request of the merchant, the integration team can help with testing payments and transfers in the production environment. To do this, merchant need to apply with a proper request to the integration chat and, after agreeing on the time/date, conduct a joint check with the integration team.

Tools and links

1. Merchant personal cabinet:

Access to personal cabinet is via the link: <https://client.elementpay.io/login>

The login and password for the personal cabinet can be provided after signing the Agency Agreement. For this merchant need:

- Go to the site <https://elementpay.io/>, click on the “Get account for Free” button, fill in and send the initial application form to form the Agency Agreement.
- After completion the application form, a link to the full registration form will be sent to the specified email.
- It is necessary to fill in the full registration form, then the Agency Agreement will be generated automatically at the last step of the registration form.
- Download, sign and upload back the signed Agency Agreement and the specified additional documents required for the KYC procedure.
- After successful documents verification, the merchant will be sent the login and password to the personal account (the password must be changed after first login).

⚠ATTENTION! The personal cabinet can be switched to the Production environment only after all necessary documents have been provided, the Agency Agreement has been signed, and the Gateway test has been successfully passed in Tidem in the Sandbox environment.

⚠ATTENTION! If the merchant has not logged into the personal cabinet for more than 90 days, for security purposes, the account will be blocked. In order to restore access to the merchant's personal cabinet, it is necessary to send a **request to** support@elementpay.io from the merchant's official/corporate e-mail, which would allow identifying the initiator of the request as an authorized representative of the merchant with the permission to change the password to the personal cabinet.

Please find a detailed information about the personal cabinet in the [Partner's personal cabinet documentation](#)

The most commonly used personal cabinet functionality:

- **Services section** . Services and fees contains the following useful information:
 - enabled payment methods,
 - payment method country,
 - fees,
 - online or offline method type,
 - invoice time to live (in seconds) from the moment of its creation (TTL)
 - how much time (in seconds) the payment will be held until it is credited to the merchant's available balance.

merchant can find information about the commission for the transfer in the subsection Transfers fees of the Services section as well.

- **Settings section** . This section contains all the necessary settings for integration:

The API keys section contains the keys needed to sign requests.

- Merchant Key is a public key used to identify the merchant when making requests, including requests from client applications. The Merchant Key is in conjunction with the Secret key.
- Secret Key is a secret key for signing requests when accessing the Merchant API. All responses from the API will be signed with the same key.
- Client API Key is a private key for accessing the Client API and Transfer API, used for authentication and authorization when making requests.

Redirect URLs. In this section merchant can specify the URLs to which the client will be redirected depending on the result of the payment (success, reject, waiting). If the fields are left empty, the redirect URLs of the Elementpay payment system will be used.

Webhooks. It is intended to be used to manage the list and parameters of Endpoints on the merchant's side, to which the payment system will send requests and notifications about various events in the system related to this merchant. If the list of Endpoints is empty, the merchant will not receive notifications from the payment system, while payments and transfers will be processed normally.

After clicking on *+Create endpoint*, in the window that opens, merchant must specify the Endpoint URL, and, if necessary, enable one or both Payments Verifier and Transfers Verifier switches, thereby indicating to the system that before processing payments and / or transfers, merchant must respond on the verification request from the payment system (see Check requests in [Callback API](#)). This request is needed to confirm the parameters of payments and / or transfers on the merchant's side, i.e. for verification. If these switches are not enabled in any Endpoint, then the payment system will carry out processing without additional verification.

In the Description field, merchant can specify a text description for the generated Endpoint.

The Events field contains a drop-down list of events about which notifications will be sent to this Endpoint URL.

⚠ATTENTION! The Endpoint contains the Signing Secret Key - the key that will be used to sign all requests from the payment system to this particular Endpoint. Endpoint responses must be signed with the same key.

Difference between the Secret key from the API keys section and the Signing secret key from the Webhooks section: API keys are used to interact with the Merchant API, and the merchant's Signing secret key is used to:

- notification signatures that the system will send to the merchant's endpoint;
- Merchant endpoint response signatures.

Each endpoint has its own unique Signing secret key. Thus, Secret key and Signing secret key are different keys and serve different purposes.

Detailed information about each of the created Endpoints, including version history, Signing secret key and Webhook detail, can be viewed and edited in the drop-down area by clicking on the Endpoint ID number.

System notifications. An important section that allows merchant to receive notifications to the specified email. For example, notification of planned technical work on the bank's side. It is highly recommended to specify an email for notification.

Authorizer. This section contains settings for the Authorizer service designed for automatic authorization of transfers.

⚠ATTENTION! The Authorizer becomes available to the merchant in the production environment (Live mode) only after **signing of [Addendum to the Agency Agreement about risks of using the Authorizer Service](#)** and successful authorization of the transfer using the Authorizer service in personal cabinet in the sandbox environment.

2. API documentation:

<https://api.elementpay.io/merchant/doc/>

The documentation contains information about the API of the Elementpay payment system

3. Tidem:

The Tidem test is only required for the following integration types: Light API/Full Integration and is not required for integration via CMS plugins.

<https://tidem.elementpay.io/>

Login: emerch

Password: dKf6Emvd1

This tool was developed specifically for testing the integration of a merchant's endpoint with the [Callback API](#) of the payment system. Tidem has no connection with the payment system, it is a separate service for emulating Check and Pay requests from the payment system and checking the responses of the merchant's endpoint.

Merchant must successfully pass the Gateway test in Tidem to switch the personal cabinet in the payment system from sandbox to a production environment.

The test results can be checked by entering the Merchant Key in the Report section.

How to use Tidem: <https://tidem.elementpay.io/how-to-use>

4. Merchant personal cabinet userguide: [Partner's personal cabinet documentation](#)

Common integration issues:

1. Request signature not matching.

Causes:

- a special character in urlencode is incorrectly encoded, for example, a "space" instead of "%20" is encoded into "+";
- the order of the parameters and their values in the request body differs from the order in the string used to calculate the hash signature;
- invalid key specified. The merchant needs to use the Signing Secret Key from the webhook settings to sign responses.

2. Unable to pass one of the tests in Tidem Gateway test. Solution: the merchant needs to compare what his endpoint answers with what is shown in the block with the expected result and understand what the discrepancy is.

3. The merchant's endpoint incorrectly responds to a Pay request from the payment system. Potential cause: usually this happens because the merchant, at the time of receiving the Pay request, can send a verification request to the payment system to receive the payment status on the [getStatus route](#) and receive an invoice status of 203, instead of the expected 205. Due to the fact that the merchant received a valid, but unexpected for him, status 203, it responds with an error to the Pay request.

FAQ:

How to request a connection to the payment system?

Merchant can initiate the process of connecting the payment system in two ways:

- visit main page [elementpay.io](#), click "Get account for Free" button and then fill the application form
- send request to our sales department email: sales@elementpay.io

What is the process of connecting to the payment system?

All our partners go through two-step registration, sign the Agency Agreement, make integration tests in Sandbox and then goes to Production environment (Live mode). All the features are available for merchants already in Sandbox environment.

What is the difference between the testing stage (Sandbox environment) and Live mode (Production environment)?

The testing stage or Sandbox mode allows merchants to make emulation payments and test withdrawals without real financial transactions.

The Live mode enables partners to receive real payments from customers.

Which documents do I need to provide to connect to the payment system?

Each partner is checked by the KYC procedure in the connection process. Merchant should provide us with a small list of documents:

- CEO's Passport (or other Identity Document) or ID Card (for Thailand residents)
- Company Report Summary (or DBD for Thailand company)
- Registration Certificate with Registration Number

How can I change the registered information (for example, company address)?

Send us the request to email support@elementpay.io

How long does it take to approve my request to connection and implement the payment service?

When we get a request for connection to our system, we need some time to check the documents via our KYC procedure. It can take 2-10 working days. Parallel to this, the integration and tests in Sandbox environment can be started. After completion of testing it takes 1-2 working days to switch the partner's account to Live mode.

What types of business are not supported?

The payment system does not work with partners from the following industries:

illegal activity, adult entertainment (including dating websies), tobacco, alcoholic beverages, pharmaceuticals, weapons, ICO, casino, gambling and bookmaking activity.

Also we do not serve sole proprietors and registered non-profit-making organizations.

Do merchant serve partners from various countries?

Yes, we offer services on the territory of Thailand, Vietnam, Philippines to partners from around the world.

Which payment methods does Elementpay offer to the partner?

For PayIns merchants may accept worldwide card payment (Visa/Mastercard) and local bank payment methods (ATM/cashier, mobile app, internet banking).

Information about the enabled payment methods can be viewed by the partner in the personal cabinet in the Services section. More information about PayIn methods can be found at [the payment system website](#).

What fees does the payment system charge?

We offer special conditions for fees and commissions to each partner, depending on the turnover of the company and the selected payment methods.

Information about fees can be viewed by the partner in the personal cabinet in the Services section.

If the merchant's monthly turnover is steadily growing, the partner can send a request to reduce the initial rates by email to support@elementpay.io.

How can I track transactions?

The partner can monitor all processed operations in real time through the interface of personal cabinet or request the status using API methods.

Can I configure access to the information in personal cabinet to my employees?

Yes, our service allow merchants to add users (company employees) in personal cabinet and manage their permissions to access information. See additional information in the [Partner's personal cabinet documentation](#).

How to ensure the safety of funds?

Payment system is certified *PCI-DSS Version 3.2*. Every year, we undergo an audit by the Payment Card Industry (PCI). Our servers only accepts HTTPS/TLS connections for API operations. All sensitive data protects by using the highest grade encryption (AES-256).

Two factor authentication (2FA) and other security settings are available depending on the partner's type of integration.

How do merchant make withdrawals?

Merchant will get the fast and simple process of withdrawals. We offer 2 ways of the account settlement: Payouts (processed manually) and Transfers (processed automatically). See additional information in the [Partner's personal cabinet documentation](#)

Do merchant make a refund to the partner's clients?

We monitor every money refund issue of our partners very closely. Each case of a refund is considered separately and individually. We are usually concerned with excessive refunds since it may mean a low satisfactory service level for customers by the merchant. Therefore we ask the merchant to improve its service as soon as possible.
